Autonics

2-Phase Closed-Loop Stepper Motor Driver **AIS-D SERIES**

INSTRUCTION MANUAL

Thank you for choosing our Autonics product.
Please read the following safety considerations before use.

■ Safety Considerations

×Please observe all safety considerations for safe and proper product operation to

★★ symbol represents caution due to special circumstances in which hazards may

Warning Failure to follow these instructions may result in serious injury or death. ⚠ Caution Failure to follow these instructions may result in personal injury or product damage.

- Fail-safe device must be installed when using the unit with machinery that may cause serious injury or substantial economic loss. (e.g. nuclear power control, medical equipment, ships, vehicles, railways, aircraft, combustion apparatus, safety equipment, crime/disaster prevention devices, etc.)
 Failure to follow this instruction may result in fire, personal injury, or economic loss.

 2. Do not connect, repair, or inspect the unit while connected to a power source.
- Failure to follow this instruction may result in fire.
- Install the unit after considering counter plan against power failure.
 Failure to follow this instruction may result in personal injury, or economic loss.

 4. Check 'Connections' before wiring.
 Failure to follow this instruction may result in fire.

 5. Denote the company of the content of the

- 5. Do not disassemble or modify the unit.

- 5. Do not disassemble or modify the unit.
 Failure to follow this instruction may result in fire.
 6. Install the driver in the grounded housing or ground it directly.
 Failure to follow this instruction may result in electronic shock, personal injury.
 7. Do not touch the unit during or after operation for a while.
 Failure to follow this instruction may result in burn due to high temperature of the surface.
- Emergency stop directly when error occurs.
 Failure to follow this instruction may result in fire, or personal injury.

▲ Caution

- When connecting the power input, use AWG 18(0.75mm²) cable or over.
 Install over-current prevention device (e.g. the current breaker, etc) to connect the driver with power.
 Failure to follow this instruction may result in fire.
- Check the control input signal before supplying power to the driver.
 Failure to follow this instruction may result in personal injury or product damage by
- 1. Install a safety device to maintain the vertical position after turn off the power of
- **this driver.**Failure to follow this instruction may result in personal injury or product damage by
- releasing holding torque of the motor.

 5. Use the unit within the rated specifications.
 Failure to follow this instruction may result in fire or product damage.

 6. Use dry cloth to clean the unit, and do not use water or organic solvent.

 To live to follow this instruction may result in fire.
- Failure to follow this instruction may result in fire.
- 7. Do not use the unit in the place where flammable/explosive/corrosive gas, humidity, direct sunlight, radiant heat, vibration, impact, or salinity may be
- present.
 Failure to follow this instruction may result in fire or explosion.

 The driver may overheat depending on the environment.

 Install the unit in the well ventilated place and forced cooling with a cooling fan. Failure to follow this instruction may result in product damage and degradation

 Neep metal chip, dust, and wire residue from flowing into the unit.

 Failure to follow this instruction may result in fire or product damage.

 10. Use the designated motor only.

 Failure to follow this instruction may result in fire or product damage.

Driver Setting

SW1: Speed filter setting switch or position control gain setting switch
-SW1 shifts its mode between the speed filter setting or position control gain setting, depending on 4th pin in
SW4 as follows.

4th pin in SW4 Setting
OFF Speed F" . values are not applied in the running status, and the values will be applied after motor stoppe

Speed filter
Position control gain

Speed filter setting
 Speed filter decides operation responsiveness of the motor to input pulse.
 Set the delay time between the position of input pulse and the position of motor to prevent load changing or

				response by	comman	d is decreased.
Setting switch	Setting	Delay time	Setting	Delay time] 4	Graph for input speed and motor responses
	0	Disable	8 ^{×1}	60ms	Position	CGraph for input speed and motor resp
180	1	2ms	9	80ms		Input pulse
6189	2	4ms	Α	100ms		position / , '
4 (၎누)이	3	6ms	В	120ms		// Motor position
640 330	4	8ms	С	140ms		Delay
	5	10ms	D	160ms		/ / time
S.F./Gain	6	20ms	E	180ms		//
	7	40ms	F	200ms		//

Position control gain setting

Position control gain setting
 Position control gain decides responsiveness of motor to position command.
 Gain setting in motor stationary state, depending on load of motor, realizes rapid positioning and stabilized

P_Gain: Adjust vibration in running drive. I_Gain: Adjust vibration in accelerating/de Setting switch Setting | Gain | Setting | Gain | P | I

3 ×1: Factory default SW2: Resolution setting switch

set the resolution or onver.

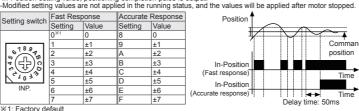

The number of pulses per 1 rotation by resolution is each 500, 1000, 1600, 2000, 3200, 3600, 5000, 6400, 7200, 10000.

Modified setting values are not applied in the running status, and the values will be applied after motor stopped.

Setting switch	Setting	Pulse/Revolution	Resolution
	0 (factory default)	500	2.5
	1	1000	5
5	2	1600	8
	3	2000	10
[[(45)]]	4	3200	16
	5	3600	18
0 0	6	5000	25
RES.	7	6400	32
	8	7200	36
	9	10000	50

SW3: In-Position setting switch
After position command pulse has finished, if the gap between target position and real position is under In-Position setting value, positioning completion pulse is output.

Modified setting values are not applied in the running status, and the values will be applied after motor stopped.

SW4: Function selection DIP switch

Set rotation direction, pulse input method, STOP current, SW1 setting, and test mode

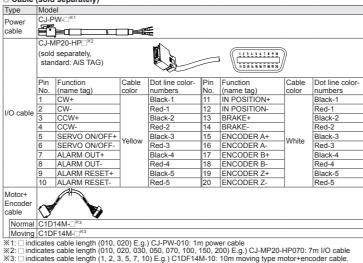

Setting switch	No.	Name	Function	Switch position			
Setting Switch	INO.	Ivallie	FUNCTION	ON	OFF (factory default)		
	1 ^{×1}	DIR	Rotation direction	CCW	CW		
ONLUUU	2 ^{×1}	1P/2P	Pulse input method	1-pulse input method	2-pulse input method		
	3×2	C.D.	STOP current	25% of max. RUN current	50% of max. RUN current		
1 2 3 4 5	4 ^{%2}	SW1 Mode	SW1 setting	Position control gain	Speed filter		
	5 ^{×3}	Reserved	Test mode	Test mode	Normal mode		
X1: When motor runs or stops, modified setting values will be applied immediately.							

※2: Modified setting values are not applied in the running status, and the values will be applied after motor stopped
※3: Set to OFF when using the device. It is only for the operation test in manufacturing process.

Input

1. Position command pulse

-Pulse input is selectable from 1-pulse input method and 2-pulse input method.

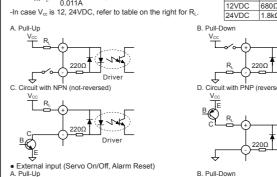

(Refer to "S W4: Function selection DIP switch".)

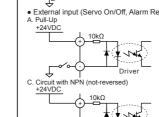

-When using extending cable, it is recommended to connect Common mode choke coil (2mH) to the CW, CCW terminal in series connection.

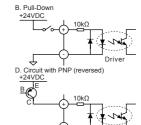

2. Servo On/Off

This circuit.

a. Example of input circuit connection **b.** Input pulse (CW, CCW) **b.** Input pulse (CW, CCW) **c.** It is recommended to use 5VDC at $V_{\rm CC}$ and short the $R_{\rm L}$. In case $V_{\rm CC}$ is over 5VDC, calculate $R_{\rm L}$ value using following formula and use $V_{\rm CC}$ below 30VDC. $R_{L} = \frac{V_{CC}-2.17V}{0.011A} - 220\Omega$

1. In-Position

In-Position output is output condition of positioning completion signal.

If the gap between target position and real position is under In-Position setting value after position command pulse has finished, In-Position output turns to [I-1] and In-Position indicator turns ON.

In reverse, when the gap is over In-Position setting value, In-Position output turns to [L] and In-Position indicator turns OFF.

For accurate drive, check the In-Position output again and execute the next drive.

Refer to example of output circuit connection.

Alarm
- This function stops motor to protect driver, depending on the error status such as over current or over speed.
-In case of normal status, output is [H], and in case of alarming status, output is [L].
- When supplying alarm reset, driver returns to the normal status.

*Refer to example of output circuit connection.

Warning
-This function notices dangers with the alarm indicator prior to over load alarm.
-When turning out from the alarming condition, driver returns to the normal status automatically.

-virien turning out from the alarming condition, driver returns to the normal status automatically.								
Alarm indicator	No. of flashing	Alarm type	Descriptions		Maintain torque			
	1	Over current error	When over current flows at motor RUN element					
	2	Over speed error	When motor speed is over 4,000rpm					
	3	Position tracking error	When the gap between position command value and current position value is over 90°					
	4	Over load error	When applying load over the rated load for over 1 sec					
	5	Over heat error	When driver inner temperature is over 80°C					
AL	6	Motor connection error	When motor cable connection error occurs at driver		×			
(red)	7	Encoder connection error	When encoder cable connection error occurs at driver	0	*			
	8	Regenerative voltage error	When regenerative voltage is over 78V					
	9	Motor misalignment	When motor is in misalignment	1 1				
	10	Command pulse error	When input pulse is over 3,500rpm					
	11	Input voltage error	When input voltage is out of 24VDC±10%					
	12	In-Position error	When position error (over 1) is kept over 3 sec, after motor stopped.					
Warning indicator		Warning type	Descriptions		Maintain torque			
PWR	4	Over load warning	When maximum load is kept connected over 10 sec.	×	0			

(motor or driver can be overheated) *Although the driver normally operates in alarming status, the driver can be damaged.

Please operate the driver, avoiding alarming situation.

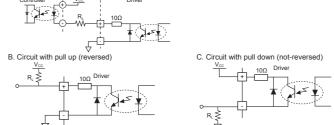

*Depending on the alarm/warning type, it flashes for 0.4 sec interval and it turns OFF for 0.8 sec repeatedly

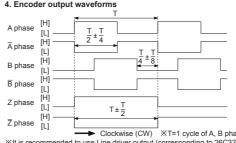

3. Example of output circuit connection

-It is recommended to use below 50VDC at V_{CC}. Use the R_L for I_C (collector current of secondary detector) of photocoupler inside the driver to be within 25mA following the below formula.

(V_F is LED forward voltage of primary photocoupler.)

A. Circuit with photocoupler V_{cc}

Encoder B o 18 Encoder Z → 19 Encoder Z̄ 0—20

Troubleshooting

①Check the connection status between controller and driver, and pulse input specifications (voltage, width).

©Check the pulse and direction signal are connected correctly.

When motor rotates to the opposite direction of the designated direction

When RUN mode is 1-pulse input method, CCW input [H] is for forward, [L] is for backward.

②When RUN mode is 2-pulse input method, check CW and CCW pulse input are changed or not.

When motor drive is unstable
 Check that driver and motor are connected correctly.

②Check the driver pulse input specifications (voltage, width).

Cautions during Use

1. Follow instructions in 'Cautions during Use'.

Otherwise, it may cause unexpected accidents. 2. 24VDC power supply should be insulated and limited voltage/current or Class 2, SELV

power supply device. 3. Re-supply power after min. 1 sec from disconnected power.

4. Do not input CW. CCW signal at the same time in 2-pulse input method.

5. When the signal input voltage is exceeded the rated voltage, connect additional resistance at the outside.

6. The thickness of cable should be same or thicker than the motor cable's when extending

7. Keep the distance between power cable and signal cable more than 10cm

8. Motor vibration and noise can occur in specific frequency period OChange motor installation method or attach the damper.

 Use the unit out of the dedicated frequency range when vibration and noise occurs due

to changing motor RUN speed. 9. For using motor, it is recommended to maintenance and inspection regularly.

①Unwinding bolts and connection parts for the unit installation and load connection ②Strange sound from ball bearing of the unit

 ⑤Damage and stress of lead cable of the unit
 ⑥Connection error with motor
 ⑤Inconsistency between the axis of motor output and the center, concentric (eccentric, declination) of the load, etc.

10. This product does not prepare protection function for a motor. 11. This unit may be used in the following environments. ①Indoors (in the environment condition rated in 'Specifications')

②Altitude max. 2,000m 3 Pollution degree 2 Installation category II
